

# Neptra Family Digital Fan Coil, PTAC, PTHP, and Wireless Thermostats

The Neptra family of controls provides an energy-saving option for fan coil, PTAC, and PTHP applications. They are proven to save on energy costs when replacing an existing mechanical fan coil control.

All of the Neptra thermostats feature a variety of field programmable options that make them extremely flexible. Plus, the wireless series provides an RF option for PTAC and PTHP applications, offering additional flexibility.

The Neptra family includes the following series:

- Neptra 4000 Series for fan coil applications
- Neptra 4500 Series for PTAC/PTHP applications
- Wireless Series for PTAC/PTHP applications
- Premier Series for fan coil applications

There are two different case styles, depending on the series, but both have large buttons and an easy-to-read display, making them simple to use in any setting. These controls are ideal for institutional and property management applications such as schools, hospitals, condominiums, apartments, etc., as well as the hospitality industry.

Options such as remote sensing and setback capability are available on selected models in the Premier series. Other custom features such as molex connectors and special programming can be requested on large quantity orders. Contact Customer Service for more information.

Please see the individual specification sheets for more detailed technical information.
